Applications

The hybrid power relay is designed to switch high inductive or capacitive loads, e.g. energy saving and LED lamps. Other applications are in heating, air conditioning and lighting systems.

Function

The hybrid switching relay contains an output relay with parallel connected triac, when switching the triac takes the load. The continuous current is then lead over the relay contact due to the higher losses on the triac. As the triac only switches off at zero-crossing, the device can only switch AC-loads.
